

## Moodling Along: Experiences with Open Source GIS in the Classroom

This is about the use of open source software in a web/classroom environment as a teaching tool for GIS software. It will cover the progress being made at COAPS, as well as at Idaho State University, University of Mass at Amherst, Penn State, and University of North Carolina.

If you are not aware of the open source movement in GIS, or the culture of open source more broadly, this is an opportunity to learn more about it. It offers free tutorials and online classes on a wide range of open source (open code, and FREE) software products.
